

1. Role of Sensors and Actuators in Healthcare

Sensors in Healthcare

Sensors are devices that detect and measure physical parameters (like temperature, pressure, heart rate, etc.) and convert them into signals that can be read and processed.

Common Types & Roles:

| Sensor Type | Parameter Measured | Application / Role |
|---|----------------------------|--|
| Temperature Sensor | Body temperature | Used in digital thermometers, patient monitoring systems |
| Heart Rate Sensor (ECG Sensor) | Heartbeat and ECG signals | Used in heart rate monitors, pacemakers |
| Blood Pressure Sensor | Blood pressure level | Used in automatic BP monitors |
| Oxygen Sensor (SpO ₂ Sensor) | Oxygen saturation in blood | Used in pulse oximeters |
| Glucose Sensor | Blood sugar level | Used in glucose monitoring devices for diabetics |
| Motion/Accelerometer Sensor | Movement and posture | Used in fall detection for elderly patients |
| EEG Sensor | Brain electrical activity | Used in brain monitoring systems |
| Respiration Sensor | Breathing rate | Used in ventilators and respiratory monitoring systems |

Actuators in Healthcare

Actuators are devices that convert electrical signals into physical action (motion, pressure, etc.) — often used to respond or assist based on sensor data.

| Actuator Type | Role in Healthcare |
|---------------|--------------------|
|---------------|--------------------|

Motor Actuators Operate robotic arms in surgeries and rehabilitation

Pump Actuators Deliver precise doses of medicine or fluids (e.g., insulin pumps)

Valve Actuators Control flow in medical devices like ventilators

Heating/Cooling Actuators Regulate temperature in incubators or therapy devices

Piezoelectric Actuators Used in ultrasound imaging devices

Microfluidic Actuators Used in lab-on-chip diagnostic systems

Example: Smart Hospital Bed

Sensors: Detect patient's heart rate, temperature, and movement.

Actuators: Automatically adjust bed height or angle for comfort and safety.

2.Role of Automobile in Case Study (Automation / Sensors & Actuators in Automobiles)

Automobiles today use sensors and actuators to improve safety, comfort, and efficiency — often studied as case studies in automation or IoT.

Sensors in Automobiles

| Sensor Type | Role / Function |
|-------------|-----------------|
|-------------|-----------------|

| | |
|---------------|---|
| Oxygen Sensor | Monitors exhaust gases to control engine fuel mixture |
|---------------|---|

| | |
|--------------|--|
| Speed Sensor | Measures wheel or vehicle speed for ABS and traction control |
|--------------|--|

| | |
|--------------------|---------------------------------------|
| Temperature Sensor | Monitors engine and cabin temperature |
|--------------------|---------------------------------------|

| | |
|-----------------------------|--------------------------------------|
| Proximity/Ultrasonic Sensor | Detects obstacles for parking assist |
|-----------------------------|--------------------------------------|

| | |
|-----------------|--|
| Pressure Sensor | Measures tire pressure or brake pressure |
|-----------------|--|

| | |
|---------------------|--|
| Camera/LiDAR Sensor | Used in autonomous vehicles for object detection |
|---------------------|--|

| | |
|-------------|--------------------------------|
| Rain Sensor | Automatically activates wipers |
|-------------|--------------------------------|

| | |
|-------------------------------|---|
| Airbag Sensor (Impact Sensor) | Detects sudden deceleration to deploy airbags |
|-------------------------------|---|

Actuators in Automobiles

| Actuator Type | Role / Function |
|---------------|-----------------|
|---------------|-----------------|

| | |
|-------------------|--|
| Throttle Actuator | Controls air intake to engine electronically |
|-------------------|--|

| | |
|----------------|--|
| Brake Actuator | Applies brakes in ABS or automatic braking systems |
|----------------|--|

| | |
|------------------------|--|
| Fuel Injector Actuator | Controls fuel flow to engine cylinders |
|------------------------|--|

| | |
|----------------------|----------------------------|
| Wiper Motor Actuator | Operates windshield wipers |
|----------------------|----------------------------|

| | |
|--------------------|-----------------------------------|
| Door Lock Actuator | Automatically locks/unlocks doors |
|--------------------|-----------------------------------|

| | |
|-------------------|---|
| Steering Actuator | Used in power steering and autonomous driving |
|-------------------|---|

Example Case Study: Automatic Emergency Braking (AEB) System

Sensors Used: Radar + Camera detect obstacles in front.

Controller: Processes data and decides if collision risk is high.

Actuator: Activates braking system automatically to prevent collision.

Summary Comparison

| Field | Sensors | Actuators | Purpose |
|------------|--|--|--|
| Healthcare | Monitor human biological parameters | Provide physical action (like pumping, moving, or controlling) | Patient monitoring, diagnosis, and treatment |
| Automobile | Monitor vehicle and environment conditions | Control mechanical systems | Safety, efficiency, comfort, and automation |
